What SSL or certificate issues do users report?

The SSL or certificate issues reported by users include errors such as "certificate verify failed: unable to get local issuer certificate". This is evident from [3], where a user reports an error with requests version 2.28.x, stating that their request fails due to the SSL error (Caused by `SSLError(SSLCertVerificationError(1, '[SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed'))`). Users also express a need for better reporting of certificate verification errors in [1], indicating that current API does not provide end-user friendly error messages.

[1] (psf/requests · issue 810) Certificate verification errors not end-user friendly
Certificate verification errors not end-user friendly
We are currently using requests in a rich client application (still in development). It is indeed a great improvement over urllib2 and friends! Especially it is great that it does verify the server certificate when using https.

The error reporting though is quite lacking - the API reports a sin...

[2] (psf/requests · issue 886) Return server's SSL certificate in Response or Session

Return server's SSL certificate in Response or Session

It's sometimes necessary to see not only boolean SSL certificate validation status but also SSL certificate contents. It would be nice to have a way to access the SSL cert as dict() available from Response or Session objects.

P.S. I can add that as I've written a module to do exactly that http...

[3] (psf/requests · issue 6235) SSL error with requests 2.28.x: certificate verify failed:

unable to get local issuer certificate

SSL error with requests 2.28.x: certificate verify failed: unable to get local issuer certificate

<!-- Summary. -->

While doing an HTTP post transfer of report payloads with requests version 2.28.1 and SSL verification set to True, the request fails giving error (Caused by
SSLError(SSLCertVerificationError(1, '[SSL: CERTIFICATE_VERIFY_FAILED] cert...
